

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (Previously Presented) A portable slave device which is connected through a predetermined coupling device to a host device comprising a file system and an application program, the slave device comprising:

a media driver for performing connection to the file system of the host device via the predetermined coupling device according to a predetermined protocol, wherein the media driver comprises at least one of a control and error correction layer, a logical-to-physical conversion layer and a file system drive layer; and

a storage device which is connected to the file system of the host device via the media driver, wherein at least a portion of the storage device operates as a storage device of the host device when the application program is used by the host device,

wherein the media device is logically connected to the file system according to a predetermined protocol between one of (a) the control and error correction layer of the media driver and a control and error correction layer of the file system such that data is transmitted from the control and error correction layer of the media driver of the slave device to the application program of the host device via the control and error correction layer of the file system of the host device, (b) the logical-to-physical conversion layer of the media driver and a logical-to-physical conversion layer of the file system of the host device such that data is

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

transmitted from the control and error correction layer and the logical-to-physical conversion layer of the media driver of the slave device to the application program via the logical-to-physical conversion layer and file system drive layer of the file system of the host device, and (c) the file system drive layer of the media driver and a file system drive layer of the file system of the host device such that data transmitted via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the media driver of the slave device is sent to the application program via the file system drive layer of the file system of the host device.

2. (Previously Presented) The slave device of claim 1, wherein the control and error correction unit of the media driver controls the storage device and detects and corrects errors.

3. (Canceled)

4. (Previously Presented) The slave device of claim 2, wherein the logical-to-physical converter of the media driver converts logical location information used by the file system into physical location information.

5. (Canceled)

6. (Currently Amended) The slave device of claim 4, wherein the [[the]] file system driver of the media driver abstracts data stored in the storage device of the slave device to allow

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

the application program to access the data stored in the storage device as a file using the logical location information.

7. (Canceled)

8. (Previously Presented) A host device connected to a portable slave device comprising a storage device through a predetermined coupling device, the host device comprising a file system for performing connection to a top layer of the slave device according to a predetermined protocol so that at least a portion of the storage device of the slave device operates as a storage device of the host device, wherein the file system comprises:

a control and error correction layer for detecting and correcting errors;

a logical-to-physical conversion layer for converting logical location information used by the file system into physical location information; and

a file system drive layer for abstracting data stored in the storage device of the slave device to allow application programs to access the data as a file using the logical location information.

9. (Original) The host device of claim 8, further comprising a top layer identification unit for identifying the top layer of the slave device during initialization for connection to the slave device.

Claims 10-15 (Canceled).

16. (Previously Presented) A portable slave device which is connected through a predetermined coupling device to a host device comprising a file system and an application program, the slave device comprising:

a media driver for performing connection to the file system of the host device via the predetermined coupling device according to a predetermined protocol; and

a storage device which is connected to the file system of the host device via the media driver, wherein at least a portion of the storage device operates as a storage device of the host device when the application program is used by the host device,

wherein the file system of the host device comprises a control and error correction layer, a logical-to-physical conversion layer, and a file system drive layer, the media driver comprises a control and error correction layer, and the slave device is logically connected to the host device according to a predetermined protocol between the control and error correction layer of the media driver of the slave device and the control and error correction layer of the file system of the host device such that data is transmitted from the control and error correction layer of the media driver of the slave device to the application program of the host device via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the file system of the host device.

17. (Previously Presented) A portable slave device which is connected through a predetermined coupling device to a host device comprising a file system and an application program, the slave device comprising:

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

a media driver for performing connection to the file system of the host device via the predetermined coupling device according to a predetermined protocol; and

a storage device which is connected to the file system of the host device via the media driver, wherein at least a portion of the storage device operates as a storage device of the host device when the application program is used by the host device,

wherein the file system of the host device comprises a logical-to-physical conversion layer and a file system drive layer, the media driver comprises a control and error correction layer and a logical-to-physical conversion layer, and the slave device is logically connected to the host device according to a predetermined protocol between the logical-to-physical conversion layer of the media driver of the slave device and the logical-to-physical conversion layer of the file system of the host device such that data is transmitted from the control and error correction layer and the logical-to-physical conversion layer of the media driver of the slave device to the application program via the logical-to-physical conversion layer and file system drive layer of the file system of the host device.

18. (Previously Presented) A portable slave device which is connected through a predetermined coupling device to a host device comprising a file system and an application program, the slave device comprising:

a media driver for performing connection to the file system of the host device via the predetermined coupling device according to a predetermined protocol; and

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

a storage device which is connected to the file system of the host device via the media driver, wherein at least a portion of the storage device operates as a storage device of the host device when the application program is used by the host device,

wherein the file system of the host device comprises a file system drive layer, the media driver comprises a control and error correction layer, a logical-to-physical conversion layer, and a file system drive layer, and the slave device is logically connected to the host device according to a predetermined protocol between the file system drive layer of the media driver of the slave device and the file system drive layer of the file system of the host device such that data transmitted via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the media driver of the slave device is sent to the application program via the file system drive layer of the file system of the host device.

19. (Previously Presented) A host device connected to a portable slave device comprising a storage device through a predetermined coupling device, the host device comprising:

a file system for performing connection to a top layer of the slave device according to a predetermined protocol so that at least a portion of the storage device of the slave device operates as a storage device of the host device; and

an application program, wherein the file system of the host device comprises a control and error correction layer, a logical-to-physical conversion layer, and a file system drive layer, the slave device comprises a media driver including a control and error correction layer, and the host device is logically connected to the slave device according to a predetermined protocol

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

between the control and error correction layer of the media driver of the slave device and the control and error correction layer of the file system of the host device such that data is transmitted from the control and error correction layer of the media driver of the slave device to the application program of the host device via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the file system of the host device.

20. (Previously Presented) A host device connected to a portable slave device comprising a storage device through a predetermined coupling device, the host device comprising:

a file system for performing connection to a top layer of the slave device according to a predetermined protocol so that at least a portion of the storage device of the slave device operates as a storage device of the host device; and

an application program, wherein the file system of the host device comprises a logical-to-physical conversion layer and a file system drive layer, the media driver comprises a media driver including a control and error correction layer and a logical-to-physical conversion layer, and the host device is logically connected to the slave device according to a predetermined protocol between the logical-to-physical conversion layer of the media driver of the slave device and the logical-to-physical conversion layer of the file system of the host device such that data is transmitted from the control and error correction layer and the logical-to-physical conversion layer of the media driver of the slave device to the application program via the logical-to-physical conversion layer and file system drive layer of the file system of the host device.

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

21. (Previously Presented) A host device connected to a portable slave device comprising a storage device through a predetermined coupling device, the host device comprising:

a file system for performing connection to a top layer of the slave device according to a predetermined protocol so that at least a portion of the storage device of the slave device operates as a storage device of the host device; and

an application program, wherein the file system of the host device comprises a file system drive layer, the media driver comprises a control and error correction layer, a logical-to-physical conversion layer, and a file system drive layer, and the host device is logically connected to the slave device according to a predetermined protocol between the file system drive layer of the media driver of the slave device and the file system drive layer of the file system of the host device such that data transmitted via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the media driver of the slave device is sent to the application program via the file system drive layer of the file system of the host device.

22. (Previously Presented) A data sharing method between a host device and a portable slave device, wherein the host device comprises an application program and a file system which includes a control and error correction layer, a logical-to-physical conversion layer and a file system drive layer, and the slave device comprises a media driver including a control and error correction layer, the method comprising the steps of:

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

(a) physically connecting the host device to the slave device through predetermined coupling device;

(b) performing connection between the host device and the slave device according to a predetermined protocol between a top layer of the slave device and the file system of the host device so that at least part of a storage device of the slave device operates as a storage device of the host device; and

(c) accessing the storage device of the slave device by the host device via the file system of the host device, the top layer of the slave device and a bottom layer of the slave system,

wherein step (b) comprises performing connection between the host device and the slave device according to a predetermined protocol between the control and error correction layer of the media driver of the slave device and the control and error correction layer of the file system of the host device, and

wherein step (c) comprises transmitting data from the control and error correction layer of the media driver of the slave device to the application program of the host device via the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the file system of the host device.

23. (Previously Presented) A data sharing method between a host device and a portable slave device, wherein the host device comprises an application program and a file system which includes a file system drive layer, and the slave device comprises a media driver including a control and error correction layer, a logical-to-physical conversion layer and a file system drive layer, the method comprising the steps of:

AMENDMENT UNDER 37 C.F.R. § 1.116
Application No. 09/597,702

(a) physically connecting the host device to the slave device through predetermined coupling device;

(b) performing connection between the host device and the slave device according to a predetermined protocol between a top layer of the slave device and the file system of the host device so that at least part of a storage device of the slave device operates as a storage device of the host device; and

(c) accessing the storage device of the slave device by the host device via the file system of the host device, the top layer of the slave device and a bottom layer of the slave system,

wherein step (b) comprises performing connection between the host device and the slave device according to a predetermined protocol between the file system drive layer of the media driver of the slave device and the file system drive layer of the file system of the host device, and

wherein step (c) comprises transmitting data from the control and error correction layer, the logical-to-physical conversion layer and the file system drive layer of the media driver of the slave device to the application program via the file system drive layer of the file system of the host device.

24. (Previously Presented) A data sharing method between a host device and a portable slave device, wherein the host device comprises an application program and a file system which includes a logical-to-physical conversion layer and a file system drive layer, and the slave device comprises a media driver including a control and error correction layer and a logical-to-physical conversion layer, the method comprising the steps of:

(a) physically connecting the host device to the slave device through predetermined coupling device;

(b) performing connection between the host device and the slave device according to a predetermined protocol between a top layer of the slave device and the file system of the host device so that at least part of a storage device of the slave device operates as a storage device of the host device; and

(c) accessing the storage device of the slave device by the host device via the file system of the host device, the top layer of the slave device and a bottom layer of the slave system,

wherein step (b) comprises performing connection between the host device and the slave device according to a predetermined protocol between the logical-to-physical conversion layer of the media driver of the slave device and the logical-to-physical conversion layer of the file system of the host device, and

wherein step (c) comprises transmitting data from the control and error correction layer and the logical-to-physical conversion layer of the media driver of the slave device to the application program via the logical-to-physical conversion layer and file system drive layer of the file system of the host device.

25. (Previously Presented) The slave device of claim 1, wherein the slave device is a portable data terminal, zip drive, MP3 player or digital camera, and the host device is a personal computer.
